| II. Ministry of Machine Construction and Blast Furnaces, BUDAPEST V, Nador Utca. | |

- 5. Each of the various departments into which this Ministry is subdivided is responsible for a group of factories. The Department of the Telecommunications Industry, BUDAPEST V, Arany Janos Utca, controls the following twelve factories which were the most important works in this industry until the October 1956 rising:
 - (a) The Hungarian Transmitter Valve Factory, BUDAPEST XIII,50X1-HUM Vaci Ut 169 employs about 500 people and its production consists mainly of transmitter valves of more than 100

Watt anode dissipation, rectifier valves, vacuum capacitors, valves for switch-gear, X-ray and gas discharge tubes (Glimmlampen), etc. A fairly complete list of the monthly production of the plant is attached to this report as Annexure 'A'.

CONFIDENTIAL

CONFIDENTIAL - 2 -

- (b) The BELOIANNIS Communications Works, BUDAPEST XI,

 Etherwari Ut 72

 employs about 2,000 people

 and produces transmitters of all types (not transmitter valves), all types of telecommunications equipment (not telephones) radio receivers, etc.
- (c) The TUNGSRAM Works, BUDAPEST IV, Vaci Ut (formerly owned and controlled by the mother factory in Sweden) employs about 5,000 to 6,000 people. Its production consists mainly of traismitter valves of less than 100 Watt capacity, all types of clystrons, radio receiver valves, electric bulbs, strip-lighting and photo electric cells. On paper the factory is still Swedish property. The Managing Director is a former Hungarian subject, now a naturalised Russian.
- (d) The ORION Factory, BUDAPEST X, employs about 1,500 to 2,000 people and produces mainly radio and television receiver sets.
- (e) The REMIX Factory, BUDAPEST X, employs about 800 people. Its main products are capacitors, resistors, potentiometers, etc.
- (f) The AUDION Factory, BUDAPEST IV, employs about 150 to 200 people and produces mainly booster stations. (Verstaerkeraemter).

|-----|--------------|--------------|--------|----------|--------------|----------|
| (0) | about 1,500 | people. | | | | 50X1-HUM |
| | | | | | | |

- (h) HIRADASTECHNIKAI ALAPANYAGYAR, VAC near BUDAPEST, employs about 150 people. Its production consists mainly of semi-finished products used by the electronics industry, such as valve bases, ferrit aerials, iron powder cores for radio coils, etc.
- (i) TELEPHON FABRIK, BUDAPEST XIV, Hungaria Ut, employs about 1,500 people and manufactures telephone equipment, cinema projectors and all types of electrical household appliances.
- (j) The Mechanical Laboratory, BUDAPEST VII, Gorkij Fasor, employs about 500 to 600 people. No details about this laboratory are available, but it is generally believed that it deals with research and development work on subjects of a military nature, possibly radar. An air of secrecy surrounds this laboratory.
- (k) RADIO CABINET FACTORY, BUDAPEST IV, employs about 200 people and produces only cabinets for radio and television receiver sets.
- (1) KARCAGIX UVEGGYAR, KARCAG near BUDAPEST, employs about 50 people and produces all glass components used by the valve factories.

| the test valves were assembled and news has been received si | nce 50X1-HUM |
| that the valves had been tested and had proved entirely sati factory in the initial tests. | .s- |
| transmitter valves with a capacity of 80 Kilowatt and 160 Kilowatt were not tested at the factory, as the necessary to equipment was not available there. As such valves had to be tested for 200 hours before delivery to the customer, these were carried out under special arrangements made with the Hungarian Broadcasting Stations. The arrangement was that Broadcasting Stations used every newly produced valve in the transmitters for 200 hours under normal broadcasting conditional, if the valve passed this test successfully, it was retto the Hungarian State-controlled Export Agency ELEKTROIMPE BUDAPEST with a certificate stating that the valve had been tested and passed as being up to the normal standards. As result of these arrangements Broadcasting Stations in Hungarian of these arrangements without having to purchase valves, and the entire output of the large expensive transmiters without having to purchase valves could be exported. Only the smaller transmitter valvere tested on the premises. 9. all valves exported by the Hungarian Transmitter Valve Factory to countries outside the East Bloc were marked with the TUNGSRAM mark and were packed that the products with the TUNGSRAM mark were actually made in another factory. | tests the eir ions, urned X in a ry itter ves 10 50X1-HUM 10 10 10 10 10 10 10 10 10 10 10 10 10 1 |

directly with the buyers, as all exports are handled exclusively by the State-controlled Export Agency ELEKTROIMPEX in BUDAPEST. The TUNGSRAM agency in which places its orders 50X1-HUM directly with the factory in BUDAPEST is an exception. 11. The remaining 25% of the transmitter valve production is for the home consumption and is mainly absorbed by the Military and Police Authorities. 50X1-HUM 12. the Factory had a fairly high percentage of rejects, due to the defective raw material available. In particular the glass envelopes supplied by KARCAGIX UVEGGYAR in KARCAG gave rise to trouble, as the glass had internal tensions which often caused the glass envelope to crack when the leads through the valve-base were sealed in. All these facts were known to the Ministry 50X1-HUM and the factory was officially allowed a wastage of as much as 20% of its output. Although the wastage exceeded this figure at times, the factory managed to keep within the permitted 20% by making false returns. 13. New development tasks were normally set by the BELOIANNIS Communications Works, when this firm received orders for a new type of transmitter. BELOIANNIS approached the Ministry with a suggested development task for a new type of transmitter valve and, after establishing that the development of a new valve was essential, the Ministry instructed the Hungarian Transmitter Valve Factory to undertake the development task. If the Ministry decided that only a few valves of a particular type were required, it gave permission to buy them, either from satellite countries or, if absolutely essential, from Western countries. 14. In order to measure the efficiency of their own types of valves the Hungarian Transmitter Valve Factory occasionally obtained valves from Western Countries by devious ways via The Western valves were then taken to pieces and 50X1-HUM analysed, in order to improve the Factory's own production, particularly of those types which were sold in the West. an organisational chart of the factory, which is attached as Annexure 'E'. Names of staff were 50X1-HUM not entered as many changes have probably taken place in the various departments 50X1-HUM at least 10, of the entire personnel, including the higher grades, had defected and are now scattered all over the world 16. It may be of interest to note that after 1950 the Hungarian valve industry had expanded to about ten times its 50X1-HUM previous volume. stopped the export of valves and other electronic gear to countries behind the Iron Curtain on account of the embargo restrictions. As the requirements in Hungary and other satellites were increasing, the local industry was forced to start its own large-scale production, and Hungary is now capable of supplying the entire demand at home, as well as export much of its production. Most of the valves
